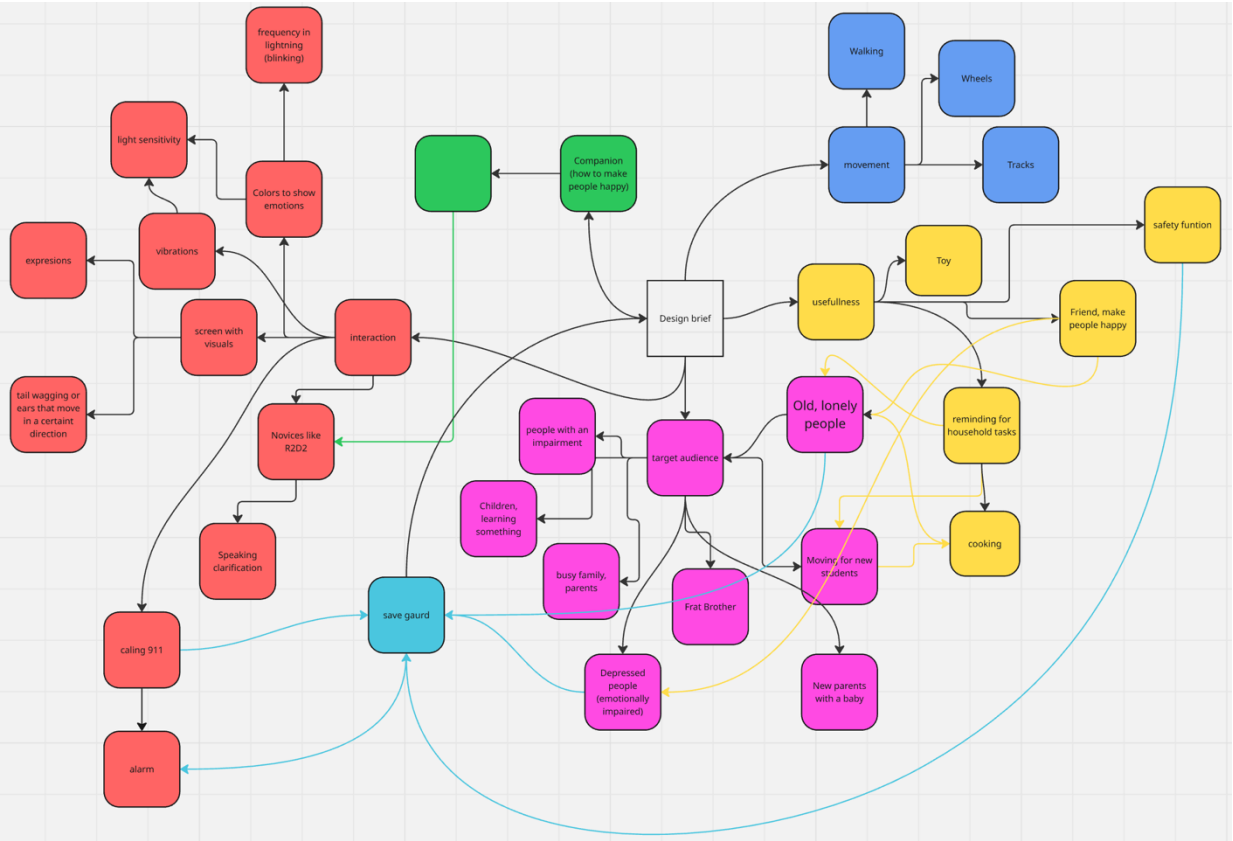
Workbook group 9

Week 1

02/02/26 **Kick off**

For our first meeting group 9 met up to get acquainted with each other where we found out:

- Individual strengths and weaknesses
- Reflections from previous CBL Project
- Created a group on WhatsApp to share work
- Created a shared workspace to be able to make the **WORKBOOK**
- Started brainstorming our idea of the design brief



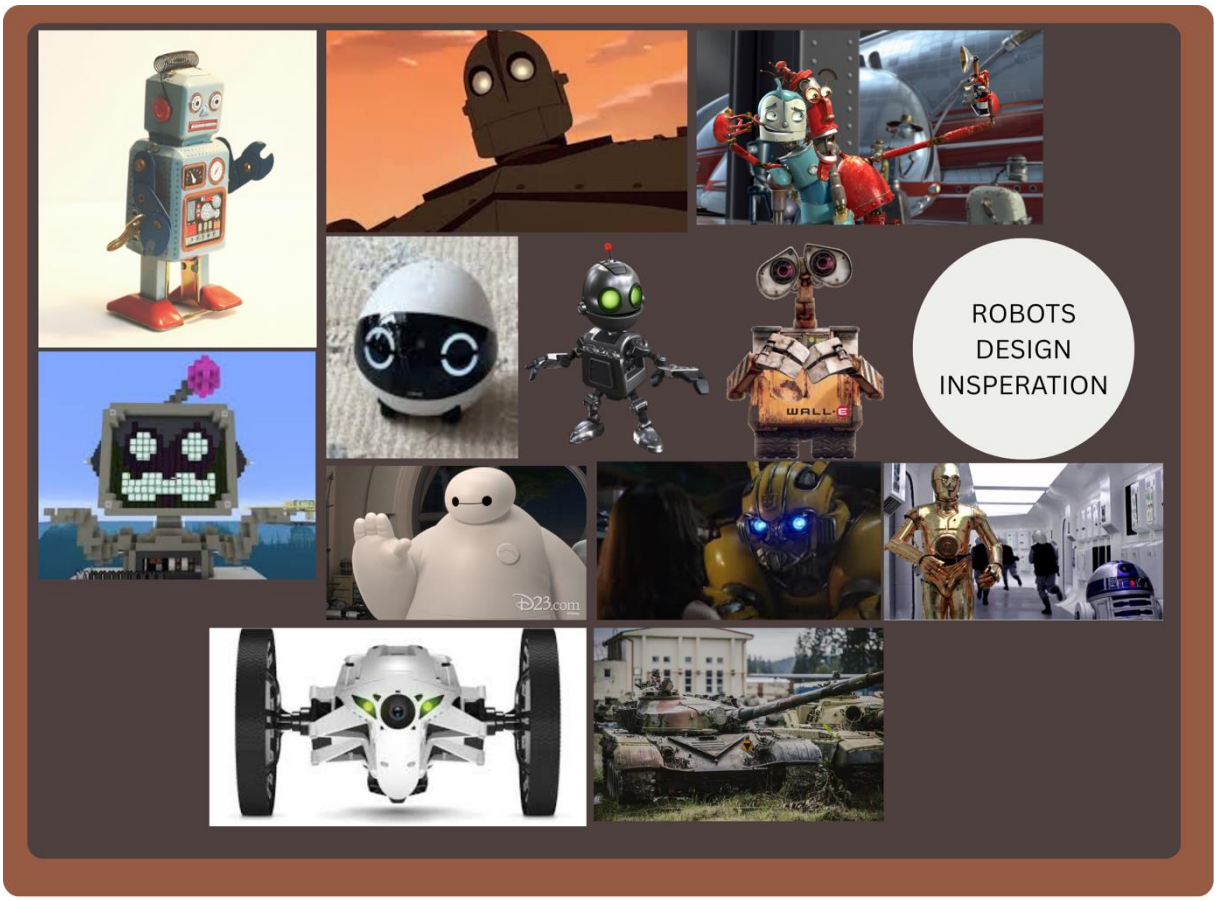
<u>FRIEND NOT DEVICE</u>

Companion:

- <u>A person</u> or <u>animal</u> with whom one spends a lot of **time** or with whom one **travels**.

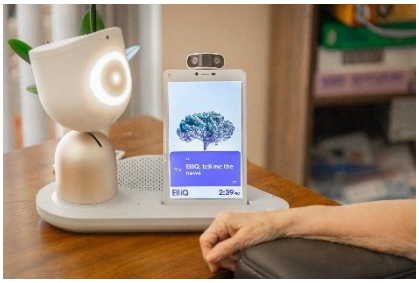
- Each of a pair of things intended to complement or match each other.
  ANIMALS

Last session we grouped our interpretations of the different requirements into idea's. we came up with the idea for a pet, a save guard, a child helper and a robot that helps with a healthy lifestyle. We have not committed to a idea yet because we want to explore different idea's first. We also looked on the internet for different inspiration.

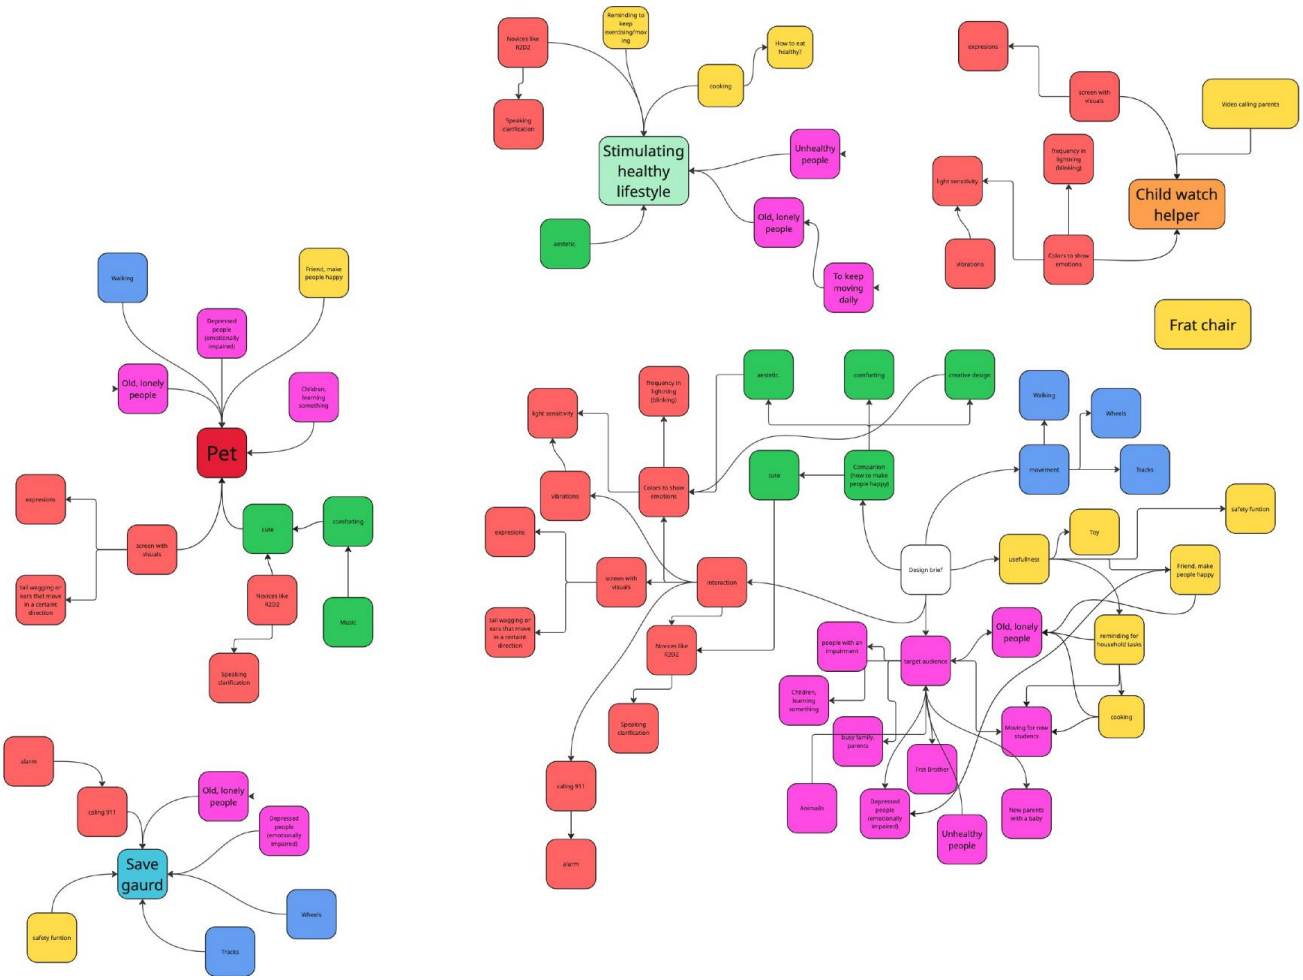


MOVIE CHARACTERS

Inspiration for companions for elderly people:



ElliQ: AI with a lamp-like robot that can talk to people, as a friend



Following the RTDP method post widening through the mind map, reflect and deepen ideas.

Save Guard: Reflecting upon the safeguard aspect of the brainstorm it seems to be quite isolated from the design brief since we are making a FRIEND NOT A DEVICE. The brief wants us to create something with wonder and delight. This means if we want to go into this direction its design needs to fill the void. Furthermore, there are positives in following this process regarding its usefulness. The user group is also quite applicable in the way that our user group will be easy to determine.

PET: Wonder and delight creature gave us the idea of showing personality through physical actions such as wagging their tails, direction of ears, eyes being expressive. Usually, pets are cute so we can take inspiration in making the robot animal like.

User Group: if we make something directed towards children we will have difficulty in user studies, so it would be more convenient if we create a product designed for 18+. Additionally, the thought of the user group being pets in the way how we create a

companion for your pet when the owner isn't home. This requires us to make further research on what is the proper process for user testing with animals.

Conclusion: Not to deviate from the design brief even though we have more flexibility in our creation it's important to take what we learnt from CBL project 1 to think of exploratory uses in our product. What I mean is that we had a lot of rules to follow in regards to (video game, educational, more than 3 players, dislocated player), meaning we should challenge our ideas and try to add depth.

Kick-Off Work Plan

Expectations and motivation
We want to aim for a 7, so we definitely pass. We want to try our best, but won't push ourselves to allnighters.
We want to make sure to have a representative prototype by the end of the first quarter. So the second quartile can be about detailing, fixing things that don't work, etc.

Team meetings
We will meet about twice a week, next to the workshops and coach sessions. Also depending on how much needs to be done.
During meetings we will clear up all the points of discussion, evaluate all the (individual) work that has been done that week and discuss what further needs to be done (for the next meeting).

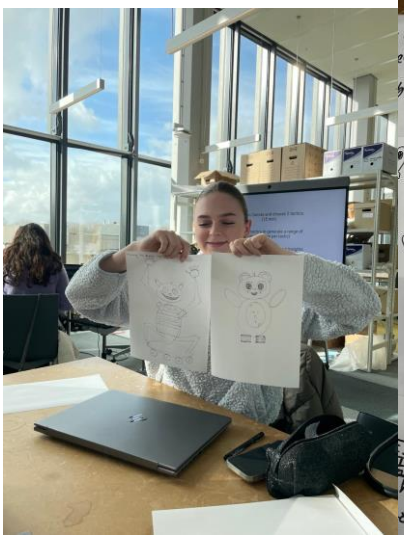
Communication within the team
We will use our group chat for urging information and discuss the rest during the meetings. We can use outlook to put in shared meetings. Decide when exactly to meet every week, during meetings or via whatsapp, as our schedule varies.

Roles, tasks and leadership
We see the value in having a chairman, will decide later on who it will be.
We will rotate the person taking minutes, so everyone will do it evenly, as no one is exited to do so.

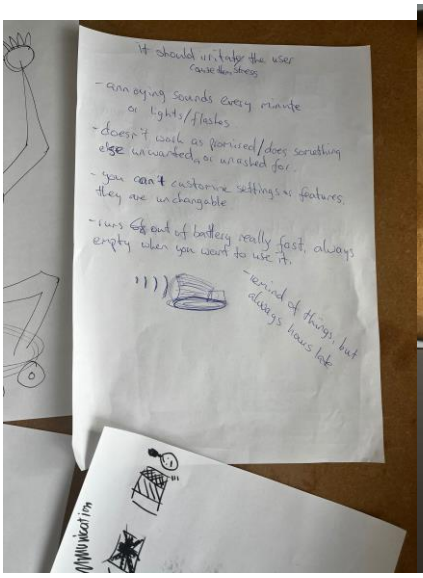
Planning
In principle, we will meet on Tuesday after the workshop and on Thursday morning before the lecture.
We will meet in the squad spaces on the 2nd floor, or reserve a room.
We will use an app for all the action points that need to be done, so everyone can see them, see who is supposed to do them and check them off when it is done.
We will set action points for every week, set ourselves deadlines every week, so we will know what to do before when.

Team rules and evaluation
Everybody does what they agreed to do, so we all spend evenly as much time on the project.
Communication is important: communicate to the group if you will be late, miss a meeting or are struggling to get something done. Always ask for help when needed.
Give each other feedback when needed during the meetings or another time. We will also have a feedback session once per quartile.
Celebrate at Lucid with every success!

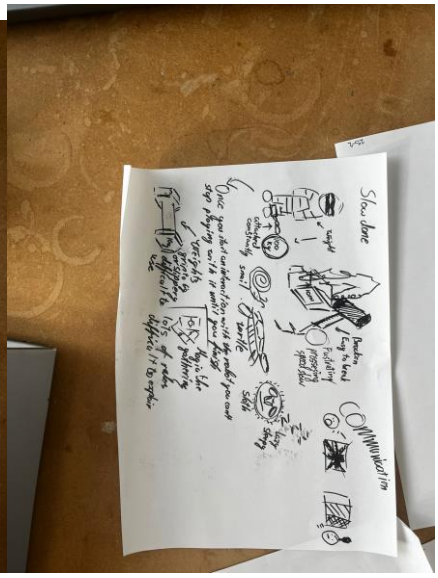
Group meeting



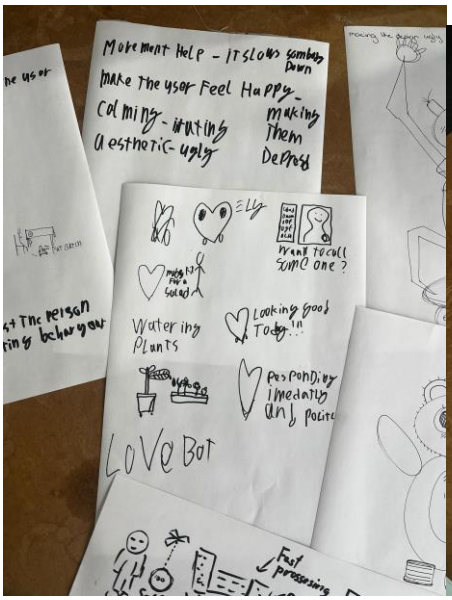
Slow down
Elly
Want to call some one?
Looking good Today!!
responding immediately and polite
Fast processing
Easy card stress



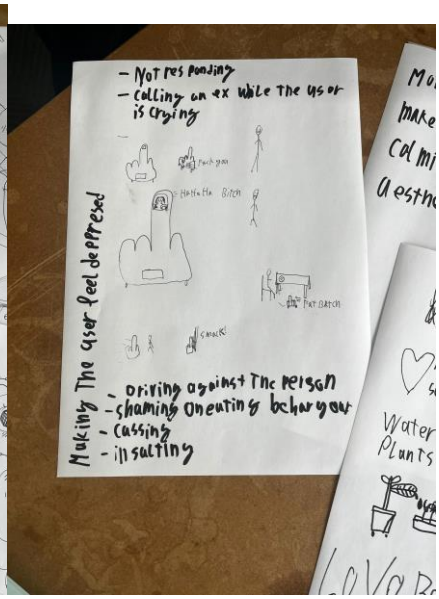
It should not take the user cause them stress
- annoying sounds every minute or lights/flashes
- doesn't work as promised/does something else unwanted, or unasked for.
- you can't customize settings or features, they are unchangable
- runs out of battery really fast, always empty when you want to use it.
- reminds of things but always leaves late



Slow down



Movement help - It slows somboy Down
make the user Feel Happy - making them Depress
Calming - irritating
aesthetic - ugly
Elly
Want to call some one?
Watering Plants
Looking good Today!!
responding immediately and polite
LoVe Bot
Fast processing



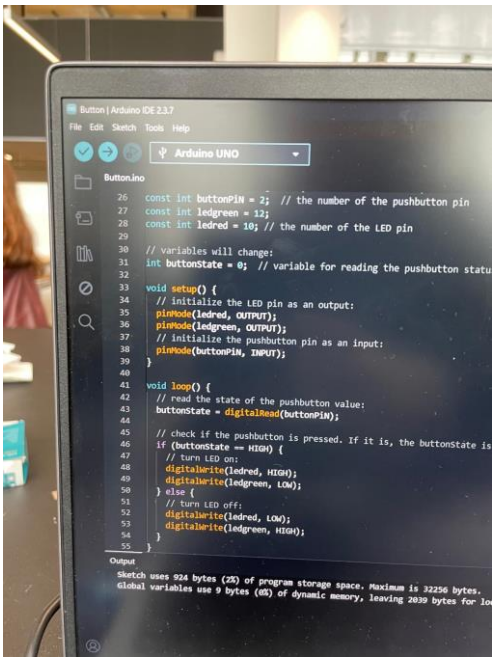
- Not responding
- calling an ex while the user is crying
Making the user feel depressed
- driving against the person
- shaming one eating behavior
- cussing
- insulting

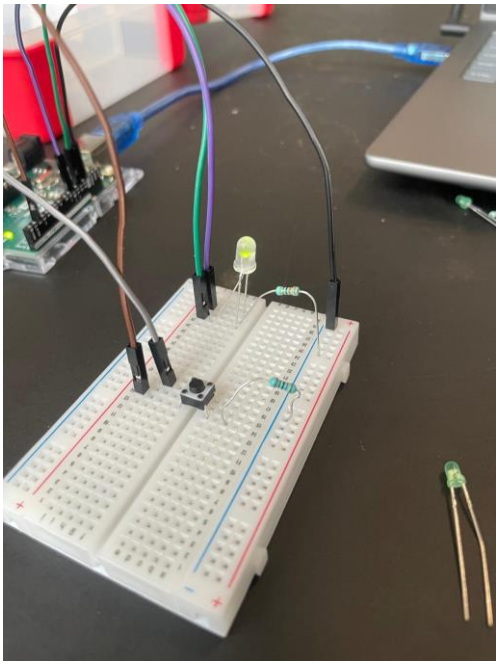
Week 2

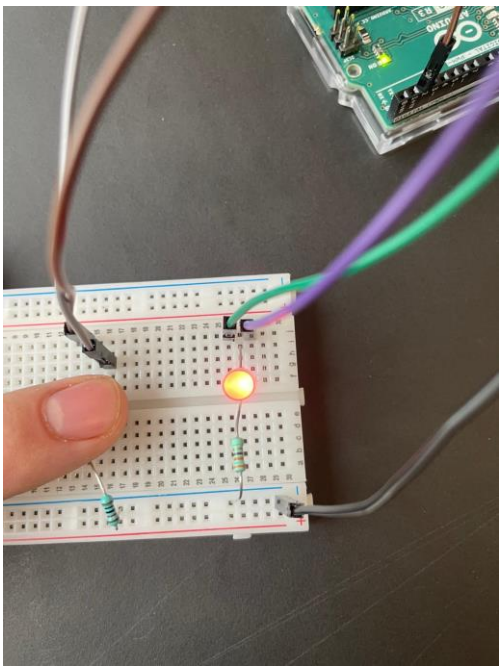
09/02/2026 **Magic Machine Workshop**

We had a workshop where we had to create a prototype based on a few prompts. Our prompts were fun, community, communication, and environment. We created a device that people in a community can have in their home to improve communication throughout the neighborhood.

10/02 **CE**







11/02/2026

Ideation based on environment.

- The example of wall E gave the environment of the earth if it was made out of garbage this environment led to the idea of creating a robot that would recycle materials in some sort of fashion

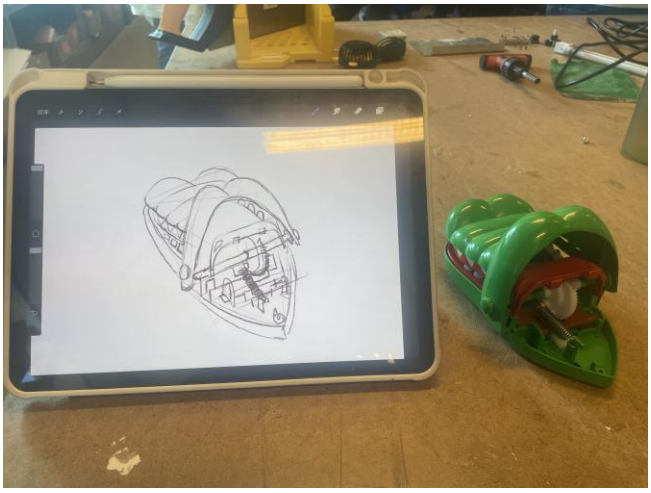
Target group we want to focus on:

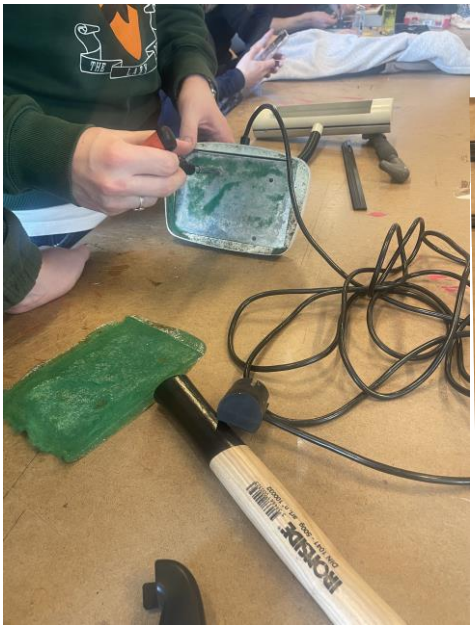
Purpose of the design:

Week 3

23/02 Absurdity Tactics

25/02 CME: Disassembly





Inversion thinking:
It should be ugly, irritating, causing stress, slowing users down, making users depressed:

- Giant middle finger that follows users around, shames them when eating, call their ex, follows them around, etc.
- Superlong manual, impossible to understand
- Heavy weight, hard to pick up or use.
- Long loading time, doesn't work when you want to.
- Follows you around with annoying sounds or lights irritating the user.
- Reminds you of things hours later than you wanted.
- Ugly creature.

Useful uselessness:

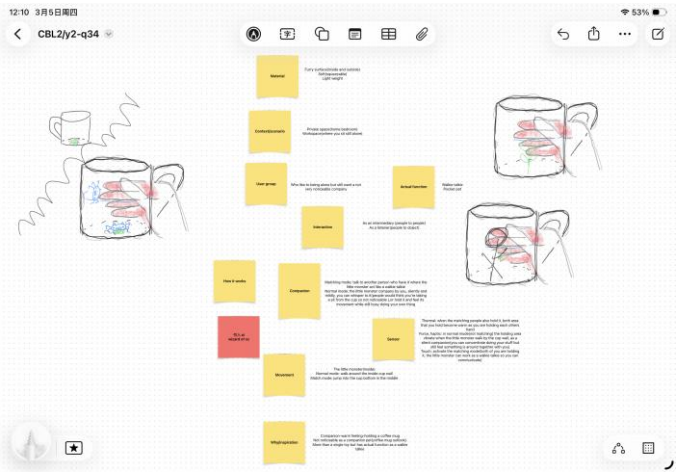
Do research: on how emotions are convayd.

Objects who convey emotions.

Like a computer who makes you angry

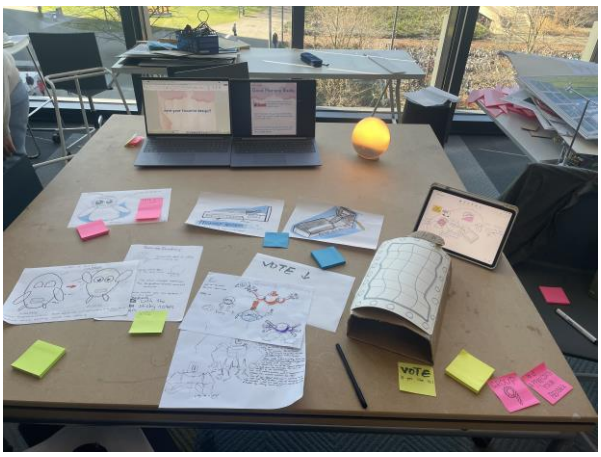
Look into how to use movement to convey emotions

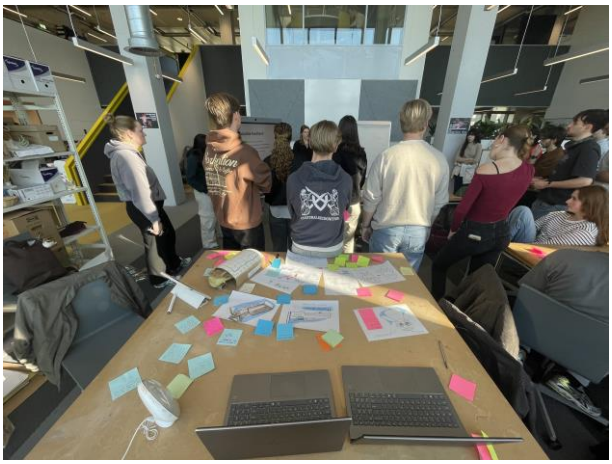
26/02 **Group meeting**

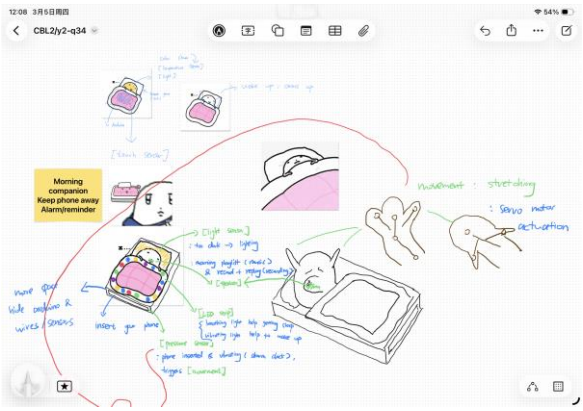


Week 4

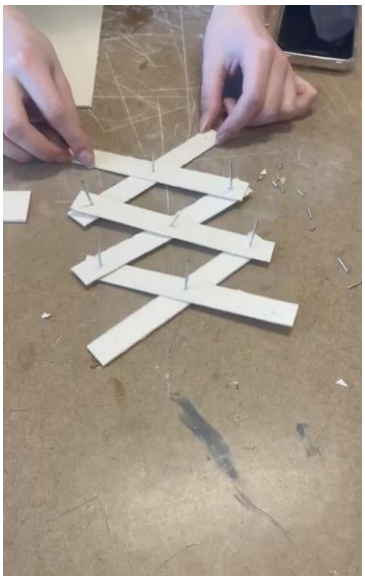
02/03 **Silent Critique1:**

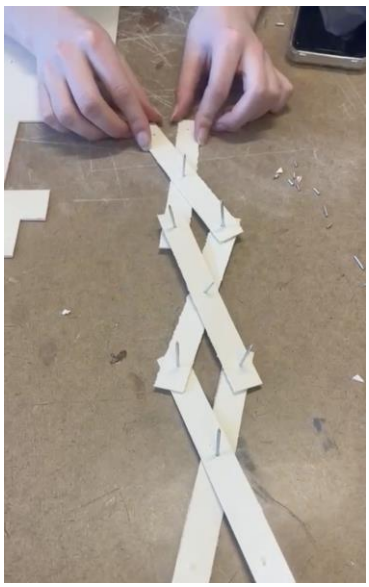


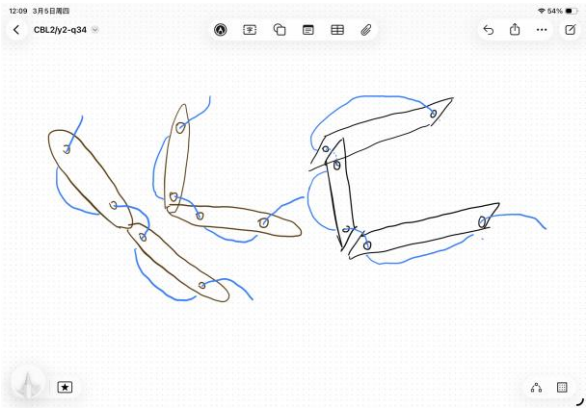




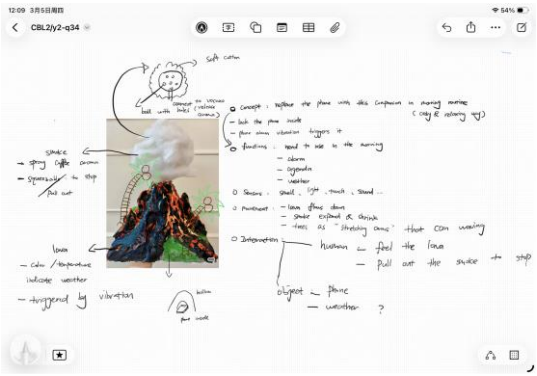
04/03 **CME:** making 3 moving mechanisms

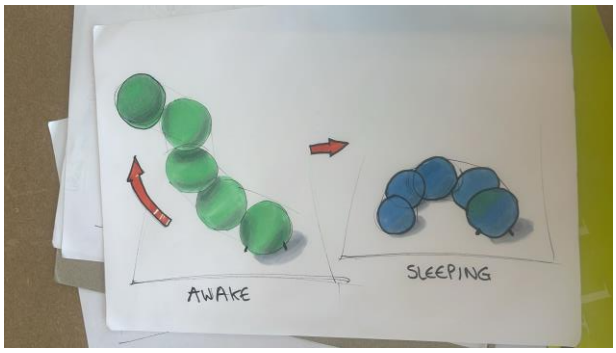


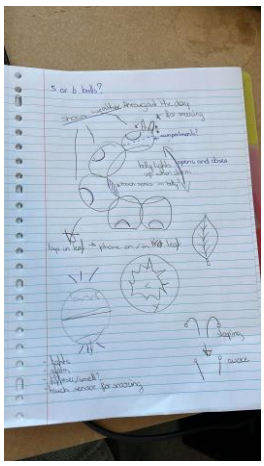




05/03 **Group meeting:** more individual ideas, came up with more out-of-the-box concepts. Stepped away from the human-like shapes and eyes. Iteration on new concept: caterpillar. This would still feel alive and could wake and rise up, but didn't look like a human.



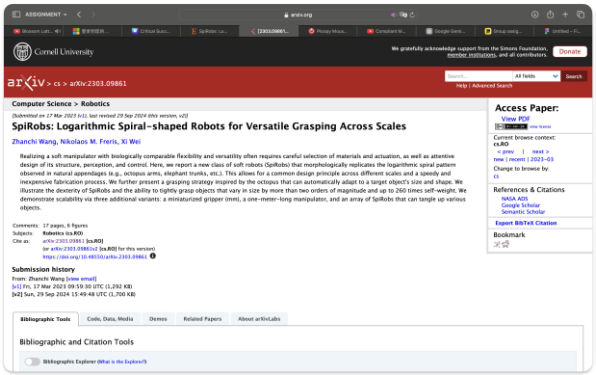


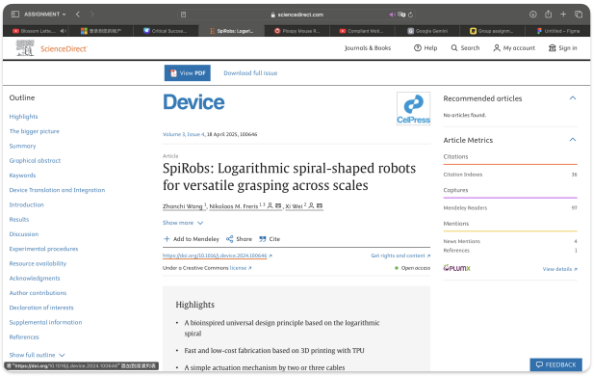


Week 5

CME:

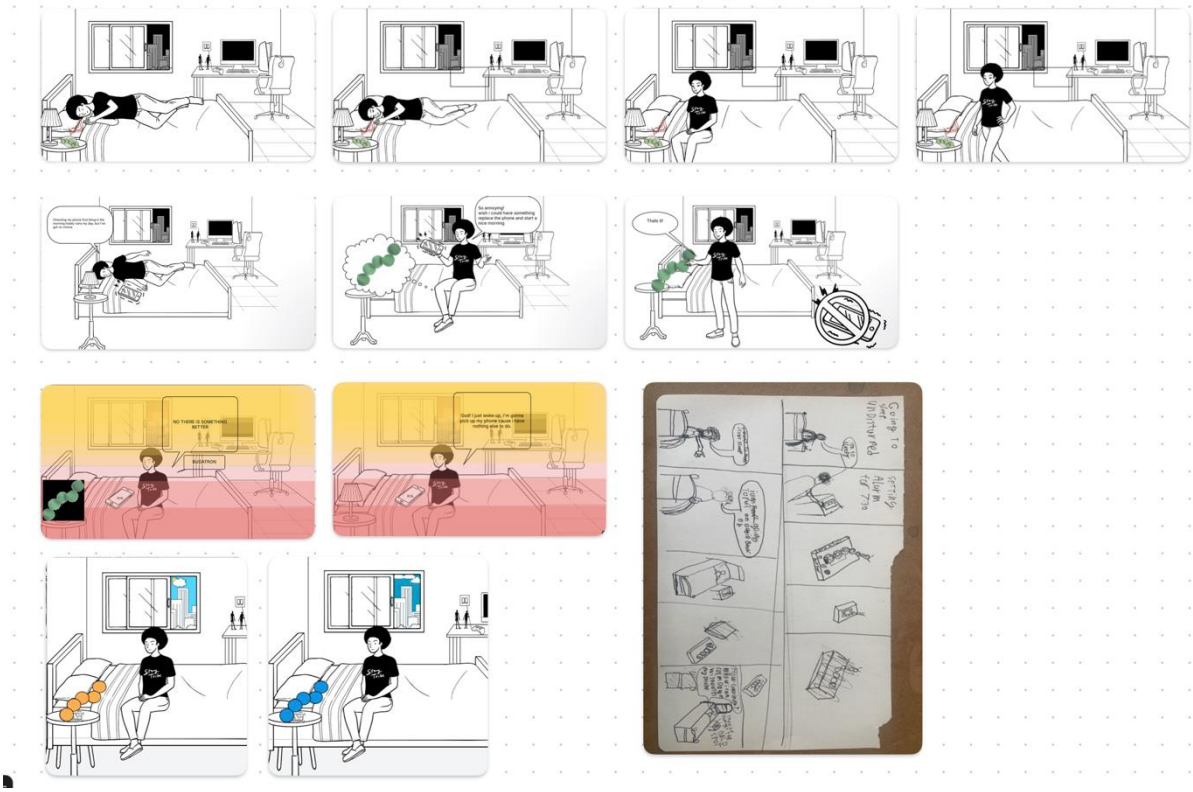
We prototyped a few iterations for the mechanisms of the caterpillar. We made it movable with strings through the different balls/shapes. We made iterations in 2D and 3D, using different materials and elastics vs. String.





Week 6

During the design studio we made a storyboard of the different functions of the device.



CE:

We connected and programmed a stepper motor to turn back and forth. This motor would automate the mechanism we made the previous week, wrapping the string around the motor, pulling it back and forth. We also want to include a potentiometer (turning button) to adjust the speed of the motor, we will do that next time.
